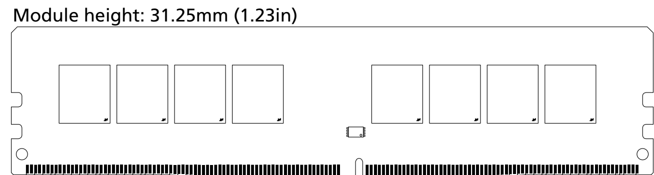
DDR4 SDRAM UDIMM

MTA16ATF1G64AZ – 8GB

Features

- DDR4 functionality and operations supported as defined in the component data sheet
- 288-pin, unbuffered dual in-line memory module (UDIMM)
- Fast data transfer rates: PC4-2400, PC4-2133, or PC4-1866
- 8GB (1 Gig x 64)
- V_{DD} = 1.21V (typical)
- V_{PP} = 2.5V (typical)
- V_{DDSPD} = 2.2–3.6V
- Nominal and dynamic on-die termination (ODT) for data, strobe, and mask signals
- Low-power auto self refresh (LPASR)
- Data bus inversion (DBI) for data bus
- On-die V_{REFDQ} generation and calibration
- Dual-rank
- On-board serial presence-detect (SPD) EEPROM
- 16 internal banks; 4 groups of 4 banks each
- Fixed burst chop (BC) of 4 and burst length (BL) of 8 via the mode register set (MRS)
- Selectable BC4 or BL8 on-the-fly (OTF)
- Gold edge contacts
- Halogen-free
- Fly-by topology
- Terminated control, command, and address bus

Figure 1: 288-Pin UDIMM (MO-309, R/C-B)



Options	Marking
• Operating temperature	
– Commercial ($0°C \le T_{OPER} \le +95°C$)	None
• Package	
– 288-pin DIMM (halogen-free)	Z
• Frequency/CAS latency	
– 0.83ns @ CL = 16 (DDR4-2400)	-2G4
– 0.93ns @ CL = 15 (DDR4-2133)	-2G1
– 1.07ns @ CL = 13 (DDR4-1866)	-1G9

Table 2: Addressing

Parameter	8GB
Row address	32K A[14:0]
Column address	1K A[9:0]
Device bank group address	4 BG[1:0]
Device bank address per group	4 BA[1:0]
Device configuration	4Gb (512 Meg x 8), 16 banks
Module rank address	2 CS_n[1:0]

Table 3: Part Numbers and Timing Parameters – 8GB Modules

Base device: MT40A512M8,[1] 4Gb DDR4 SDRAM

Part Number[2]	Module Density	Configuration	Module Bandwidth	Memory Clock/ Data Rate	Clock Cycles (CL-^{t}RCD-^{t}RP)
MTA16ATF1G64AZ-2G4__	8GB	1 Gig x 64	19.2 GB/s	0.83ns/2400 MT/s	16-16-16
MTA16ATF1G64AZ-2G1__	8GB	1 Gig x 64	17.0 GB/s	0.93ns/2133 MT/s	15-15-15
MTA16ATF1G64AZ-1G9__	8GB	1 Gig x 64	14.9 GB/s	1.07ns/1866 MT/s	13-13-13

Notes:
1. The data sheet for the base device can be found on Micron's web site.
2. All part numbers end with a two-place code (not shown) that designates component and PCB revisions. Consult factory for current revision codes. Example: MTA16ATF1G64AZ-2G1A1.

Pin Descriptions

The pin description table below is a comprehensive list of all possible pins for DDR4 UDIMM, RDIMM, SODIMM and LRDIMM modules. All pins listed may not be supported on the module defined in this data sheet. See functional block diagram specific to this module to review all pins utilized on this module.

Table 5: Pin Descriptions

Symbol	Type	Description
Ax	Input	**Address inputs:** Provide the row address for ACTIVATE commands and the column address for READ/WRITE commands to select one location out of the memory array in the respective bank. (A10/AP, A12/BC_n, WE_n/A14, CAS_n/A15, and RAS_n/A16 have additional functions; see individual entries in this table). The address inputs also provide the op-code during the MODE REGISTER SET command. A17 is only defined for x4 SDRAM configuration.
A10/AP	Input	**Auto precharge:** A10 is sampled during READ and WRITE commands to determine whether auto precharge should be performed to the accessed bank after a READ or WRITE operation (HIGH = Auto precharge; LOW = No auto precharge). A10 is sampled during a PRECHARGE command to determine whether the PRECHARGE applies to one bank (A10 LOW) or all banks (A10 HIGH). If only one bank is to be precharged, the bank is selected by the bank group and bank addresses.
A12/BC_n	Input	**Burst chop:** A12/BC_n is sampled during READ and WRITE commands to determine if burst chop (on-the-fly) will be performed. (HIGH = No burst chop; LOW = Burst-chopped). See the Command Truth Table in DDR4 component data sheet for more information.
ACT_n	Input	**Command input:** ACT_n defines the activation command being entered along with CS_n. The input into RAS_n/A16, CAS_n/A15, and WE_n/A14 will be considered as row address A16, A15, and A14. See the Command Truth Table in DDR4 component data sheet for more information.
BAx	Input	**Bank address inputs:** Define to which bank an ACTIVATE, READ, WRITE, or PRECHARGE command is being applied. Also determines which mode register is to be accessed during a MODE REGISTER SET command.
BGx	Input	**Bank group address inputs:** Define which bank group a REFRESH, ACTIVATE, READ, WRITE, or PRECHARGE command is being applied. Also determines which mode register is to be accessed during a MODE REGISTER SET command. BG[1:0] are used in the x4 and x8 configurations. x16 based SDRAMs only have BG0.
C0, C1, C2 (RDIMM/LRDIMM Only)	Input	**Chip ID:** These inputs are used only when devices are stacked, that is, 2H, 4H, and 8H stacks for x4 and x8 configurations using though-silicon vias (TSVs). These pins are not used in the x16 configuration. Some DDR4 modules support a traditional DDP package, which use CS1_n, CKE1, and ODT1 to control the second die. For all other stack configurations, such as a 4H or 8H, it is assumed to be a single-load (master/slave)-type configuration where C0, C1, and C2 are used as chip ID selects in conjunction with a single CS_n, CKE, and ODT. Chip ID is considered part of the command code.
CKx_t CKx_c	Input	**Clock:** Differential clock inputs. All address, command, and control input signals are sampled on the crossing of the positive edge of CK_t and the negative edge of CK_c.

Micron Technology, Inc. reserves the right to change products or specifications without notice.
© 2013 Micron Technology, Inc. All rights reserved.

Table 5: Pin Descriptions (Continued)

Symbol	Type	Description
CKEx	Input	**Clock enable:** CKE HIGH activates, and CKE LOW deactivates, the internal clock signals, device input buffers, and output drivers. Taking CKE LOW provides PRECHARGE POWER-DOWN and SELF REFRESH operations (all banks idle), or active power-down (row active in any bank). CKE is asynchronous for self refresh exit. After V_{REFCA} has become stable during the power-on and initialization sequence, it must be maintained during all operations (including SELF REFRESH). CKE must be held HIGH throughout read and write accesses. Input buffers (excluding CK_t, CK_c, ODT, RESET_n, and CKE) are disabled during power-down. Input buffers (excluding CKE and RESET#) are disabled during self refresh.
CSx_n	Input	**Chip select:** All commands are masked when CS_n is registered HIGH. CS_n provides external rank selection on systems with multiple ranks. CS_n is considered part of the command code. CS2_n and CS3_n are not used on UDIMMs.
ODTx	Input	**On-die termination:** ODT (registered HIGH) enables termination resistance internal to the DDR4 SDRAM. When ODT is enabled, on-die termination (R_{TT}) is applied only to each DQ, DQS_t, DQS_c, DM_n/DBI_n/TDQS_t, and TDQS_c signal for x4 and x8 configurations (when the TDQS function is enabled via the mode register). For the x16 configuration, R_{TT} is applied to each DQ, DQSU_t, DQSU_c, DQSL_t, DQSL_c, UDM_n, and LDM_n signal. The ODT pin will be ignored if the mode registers are programmed to disable R_{TT}.
PARITY	Input	**Parity for command and address:** This function can be enabled or disabled via the mode register. When enabled in MR5, then DRAM calculates Parity with ACT_n, RAS_n/A16, CAS_n/A15, WE_n/A14, BG[1:0], BA[1:0], A[16:0]. Input parity should be maintained at the rising edge of the clock and at the same time with command and address with CS_n LOW.
RAS_n/A16 CAS_n/A15 WE_n/A14	Input	**Command inputs:** RAS_n/A16, CAS_n/A15, and WE_n/A14 (along with CS_n) define the command and/or address being entered. Those pins have multifunction. For example, for activation with ACT_n LOW, these are addresses like A16, A15, and A14, but for a non-activation command with ACT_n HIGH, these are command pins for READ, WRITE, and other commands defined in the command truth table.
RESET_n	CMOS Input	**Active LOW asynchronous reset:** Reset is active when RESET_n is LOW; inactive when RESET_n is HIGH. RESET_n must be HIGH during normal operation.
SAx	Input	**Serial address inputs:** Used to configure the temperature sensor/SPD EEPROM address range on the I^2C bus.
SCL	Input	**Serial clock for temperature sensor/SPD EEPROM:** Used to synchronize communication to and from the temperature sensor/SPD EEPROM on the I^2C bus.
DQx, CBx	I/O	**Data input/output and Check Bit input/output :** Bidirectional data bus. DQ represents DQ[3:0], DQ[7:0], and DQ[15:0] for the x4, x8, and x16 configurations, respectively. If cyclic redundancy checksum (CRC) is enabled via the mode register, then CRC code is added at the end of the data burst. Either one or all of DQ0, DQ1, DQ2, or DQ3 is/are used for monitoring of internal V_{REF} level during test via mode register setting MR[4] A[4] = HIGH; training times change when enabled.

Micron Technology, Inc. reserves the right to change products or specifications without notice.

Table 5: Pin Descriptions (Continued)

Symbol	Type	Description
DM_n/DBI_n/ TDQS_t(DMU_n,DBI U_n),(DML_n/ DBII_n)	I/O	**Input Data Mask and Data Bus Inversion:** DM_n is an input mask signal for write data. Input data is masked when DM_n is sampled LOW coincident with that input data during a write access. DM_n is sampled on both edges of DQS. DM is mux'ed with DBI function by mode register A10, A11, A12 setting in MR5. For x8 device, the function of DM or TDQS is enabled by mode register A11 setting in MR1. DBI_n is an input/output identifying whether to store/output the true or inverted data. If DBI_n is LOW, the data will be stored/output after inversion inside the DDR4 SDRAM and not inverted if DBI_n is HIGH. TDQS is only supported in x8 SDRAM configurations. TDQS is not valid for UDIMMs.
DQS_t DQS_c DQSU_t DQSU_c DQSL_t DQSL_c	I/O	**Data strobe:** Output with read data, input with write data. Edge-aligned with read data, centered-aligned with WRITE data. For x16 configurations, DQSL corresponds to the data on DQ[7:0]; DQSU corresponds to the data on DQ[15:8]. For the x4 and x8 configurations, DQS corresponds to the data on DQ[3:0] and DQ[7:0] respectively. DDR4 SDRAM support a differential data strobe only and do not support a single-ended data strobe.
ALERT_n	Output	**Alert output:** Possesses multifunctions such as CRC error flag and command and address parity error flag as output signal. If there is a CRC error, then ALERT_n goes LOW for the period time interval and returns HIGH. If there is error in command address parity check, then ALERT_n goes LOW until on-going DRAM internal recovery transaction is complete. During connectivity test mode this pin functions as an input. Using this signal or not is dependent on the system. If not connected as signal, ALERT_n pin must be connected to V_{DD} on DIMM.
EVENT_n	Output	**Temperature event:** The EVENT_n pin is asserted by the temperature sensor when critical temperature thresholds have been exceeded. This pin has no function (NF) on modules without temperature sensors.
TDQS_t TDQS_c (x8 DRAM based RDIMM only)	Output	**Termination data strobe:** TDQS_t and TDQS_c are not valid for UDIMMs. When enabled via the mode register, the SDRAM enable the same R_{TT} termination resistance on TDQS_t and TDQS_c that is applied to DQS_t and DQS_c. When the TDQS function is disabled via the mode register, the DM/TDQS_t pin provides the data mask (DM) function, and the TDQS_c pin is not used. The TDQS function must be disabled in the mode register for both the x4 and x16 configurations. The DM function is supported only in x8 and x16 configurations. DM, DBI, and TDQS are a shared pin and are enabled/disabled by mode register settings. For further information about TDQS, refer to DDR4 DRAM data sheet.
V_{DD}	Supply	**Module Power supply:** 1.21V (typical)
V_{PP}	Supply	**DRAM activating power supply:** 2.5V -0.125V / +0.250V
V_{REFCA}	Supply	Reference voltage for control, command, and address pins.
V_{SS}	Supply	Ground.
V_{TT}	Supply	Power supply for termination of address, command, and control, $V_{DD}/2$.
V_{DDSPD}	Supply	Power supply used to power the I^2C bus used for SPD.
RFU	–	Reserved for future use.
NC	–	**No connect:** No internal electrical connection is present.
NF	–	**No function:** Internal connection may be present but has no function.

General Description

High-speed DDR4 SDRAM modules use DDR4 SDRAM devices with 2 or 4 internal memory bank groups. DDR4 SDRAM modules utilizing 4- and 8-bit-wide DDR4 SDRAM have 4 internal bank groups consisting of 4 memory banks each, providing a total of 16 banks. Sixteen-bit-wide DDR4 SDRAM has 2 internal bank groups consisting of 4 memory banks each, providing a total of 8 banks. DDR4 SDRAM modules benefit from DDR4 SDRAM's use of an 8*n*-prefetch architecture with an interface designed to transfer two data words per clock cycle at the I/O pins. A single READ or WRITE operation for the DDR4 SDRAM effectively consists of a single 8*n*-bit-wide, four-clock data transfer at the internal DRAM core and eight corresponding *n*-bit-wide, one-half-clock-cycle data transfers at the I/O pins.

DDR4 modules use two sets of differential signals: DQS_t, DQS_c to capture data and CK_t and CK_c to capture commands, addresses, and control signals. Differential clocks and data strobes ensure exceptional noise immunity for these signals and provide precise crossing points to capture input signals.

Fly-By Topology

DDR4 modules use faster clock speeds than earlier DDR technologies, making signal quality more important than ever. For improved signal quality, the clock, control, command, and address buses have been routed in a fly-by topology, where each clock, control, command, and address pin on each DRAM is connected to a single trace and terminated (rather than a tree structure, where the termination is off the module near the connector). Inherent to fly-by topology, the timing skew between the clock and DQS signals can be easily accounted for by using the write-leveling feature of DDR4.

Serial Presence-Detect EEPROM Operation

DDR4 SDRAM modules incorporate serial presence-detect. The SPD data is stored in a 512-byte JEDEC JC-42.4-compliant EEPROM that is segregated into 4, 128-byte, write protectable blocks. The SPD content is aligned with these blocks as follows.

Block	Range		Description
0	0–127	0x000–0x07F	Configuration and DRAM parameters
1	128–255	0x080–0x0FF	Module parameters
2	256–319	0x100–0x13F	Reserved – All bytes coded as 0x00
	320–383	0x140–0x1FF	Manufacturing information
3	384–511	0x180–0x1FF	End-user programmable

The first 384 bytes are programmed by Micron to comply with JEDEC standard JC-45, "Appendix X: Serial Presence Detect (SPD) for DDR4 SDRAM Modules." The remaining 128 bytes of storage are available for use by the customer.

The EEPROM resides on a two-wire I2C serial interface and is not integrated with the memory bus in any manner. It operates as a slave device in the I2C bus protocol, with all operations synchronized by the serial clock. Transfer rates of up to 1 MHz are achievable at 2.2–3.6V.

Micron implements reversible software write protection on DDR4 SDRAM-based modules. This prevents the lower 384 bytes (bytes 0–383) from being inadvertently program-

med or corrupted. The upper 128 bytes remain available for customer use and unprotected.

Electrical Specifications

Stresses greater than those listed may cause permanent damage to the module. This is a stress rating only, and functional operation of the module at these or any other conditions outside those indicated in each device's data sheet is not implied. Exposure to absolute maximum rating conditions for extended periods may adversely affect reliability.

Table 7: Absolute Maximum Ratings

Symbol	Parameter	Min	Max	Units	Notes
V_{DD}	V_{DD} supply voltage relative to V_{SS}	–0.4	1.5	V	1
V_{DDQ}	V_{DDQ} supply voltage relative to V_{SS}	–0.4	1.5	V	1
V_{PP}	Voltage on VPP pin relative to Vss	-0.4	3.0	V	2
V_{IN}, V_{OUT}	Voltage on any pin relative to V_{SS}	–0.4	1.5	V	

Table 8: Operating Conditions

Symbol	Parameter	Min	Nom	Max	Units	Notes
V_{DD}	V_{DD} supply voltage	1.14	1.2	1.26	V	1
V_{PP}	DRAM Activating Power Supply	2.375	2.5	2.750	V	2
$V_{REFCA(DC)}$	Input reference voltage command/ address bus	0.49 × V_{DD}	0.5 × V_{DD}	0.51 × V_{DD}	V	3
I_{VTT}	Termination reference current from V_{TT}	-750	–	750	mA	
V_{TT}	Termination reference voltage (DC) – command/address bus	0.49 × V_{DD} - 20mV	0.5 × V_{DD}	0.51 × V_{DD} + 20mV	V	4
I_I	Input leakage current; Any input excluding ZQ; 0V < V_{IN} < 1.1V.	-2.0	–	2.0	µA	5
$I_{I/O}$	DQ leakage; $0V<V_{in}<V_{DD}$	-4.0	–	4.0	µA	5
I_I	Input leakage current; ZQ	-3.0	–	3.0	µA	5,6
I_{OZpd}	Output leakage current; $V_{OUT} = V_{DD}$; DQ are disabled.	–	–	5.0	µA	
I_{OZpu}	Output leakage current; $V_{OUT} = V_{SS}$; DQ and ODT are disabled; ODT is disabled with ODT input HIGH .	–	–	5.0	µA	
I_{VREFCA}	V_{REFCA} leakage; $V_{REFCA} = V_{DD}/2$ (After DRAM is initialized)	-2.0	–	2.0	µA	5

Notes:
1. V_{DDQ} tracks with V_{DD}; V_{DDQ} and V_{DD} are tied together.
2. V_{PP} must be greater than or equal to V_{DD} at all times.
3. V_{REFCA} must not be greater than 0.6 x V_{DD}. When V_{DD} are less than 500mV; V_{REF} may be less than or equal to 300mV.
4. V_{TT} termination voltages in excess of specification limit will adversely affect command and address signals' voltage margins, and reduce timing margins.
5. Multiply by the number of DRAM die on the module.
6. Tied to ground. Not connected to edge connector.

Table 9: Thermal Characteristics

Parameter/Condition	Value	Units	Symbol	Notes
Operating case temperature - Commercial	0 to +85	°C	T_C	1, 2, 3
	>85 to +95	°C	T_C	1, 2, 3, 4
Normal operating temperature range	0 to +85	°C	T_{OPER}	5,6
Extended temperature operating range (optional)	>85 to 95	°C	T_{OPER}	5,6

Notes:
1. MAX operating case temperature. T_C is measured in the center of the package.
2. A thermal solution must be designed to ensure the DRAM device does not exceed the maximum T_C during operation.
3. Device functionality is not guaranteed if the DRAM device exceeds the maximum T_C during operation.
4. If T_C exceeds 85°C, the DRAM must be refreshed externally at 2x refresh, which is a 3.9μs interval refresh rate.
5. The refresh rate is required to double when 85°C < T_{OPER} ≤ 95°C.
6. For additional information, refer to technical note TN-00-08: "Thermal Applications" available on Micron's web site.

DRAM Operating Conditions

Recommended AC operating conditions are given in the DDR4 component data sheets. Component specifications are available on Micron’s web site. Module speed grades correlate with component speed grades, as shown below.

Table 10: Module and Component Speed Grades

DDR4 components may exceed the listed module speed grades; module may not be available in all listed speed grades

Module Speed Grade	Component Speed Grade
-2G4	-083E
-2G1	-093E
-1G9	-107E

Design Considerations

Simulations

Micron memory modules are designed to optimize signal integrity through carefully designed terminations, controlled board impedances, routing topologies, trace length matching, and decoupling. However, good signal integrity starts at the system level.

Micron encourages designers to simulate the signal characteristics of the system's memory bus to ensure adequate signal integrity of the entire memory system.

Power

Operating voltages are specified at the edge connector of the module, not the DRAM. Designers must account for any system voltage drops at anticipated power levels to ensure the required supply voltage is maintained.

I_{DD} Specifications

Table 11: DDR4 I_{DD} Specifications and Conditions – 8GB (Die Revision A)

Values are for the MT40A512M8 DDR4 SDRAM only and are computed from values specified in the 4Gb (512 Meg x 8) component data sheet

Parameter	Symbol	2400	2133	1866	Units
One bank ACTIVATE-PRECHARGE current	I_{DD0}[1]	512	496	480	mA
One bank ACTIVATE-PRECHARGE, wordline boost, I_{PP} current	I_{PP0}[1]	56	56	56	mA
One bank ACTIVATE-READ-PRECHARGE current	I_{DD1}[1]	600	584	568	mA
Precharge standby current	I_{DD2N}[2]	544	520	496	mA
Precharge standby ODT current	I_{DD2NT}[1]	544	520	496	mA
Precharge power-down current	I_{DD2P}[2]	256	256	256	mA
Precharge quite standby current	I_{DD2Q}[2]	400	400	400	mA
Active standby current	I_{DD3N}[2]	624	592	560	mA
Active standby I_{PP} current	I_{PP3N}[2]	48	48	48	mA
Active power-down current	I_{DD3P}[2]	320	320	320	mA
Burst read current	I_{DD4R}[1]	1288	1208	1128	mA
Burst read I_{DDQ} current	I_{DDQ4R}[1]	416	384	352	mA
Burst write current	I_{DD4W}[1]	1408	1248	1128	mA
Burst refresh current (1x REF)	I_{DD5B}[1]	968	968	968	mA
Burst refresh I_{PP} current (1x REF)	I_{PP5B}[1]	120	120	120	mA
Self refresh current: Normal temperature range (0–85°C)	I_{DD6N}[2]	304	304	304	mA
Self refresh current: Extended temperature range (0–95°C)	I_{DD6E}[2]	368	368	368	mA
Self refresh current: Reduced temperature range (0–45°C)	I_{DD6R}[2]	144	144	144	mA
Auto self refresh current (25°C)	I_{DD6A}[2]	96	96	96	mA
Auto self refresh current (45°C)	I_{DD6A}[2]	144	144	144	mA
Auto self refresh current (75°C)	I_{DD6A}[2]	192	192	192	mA
Bank interleave read current	I_{DD7}[1]	1808	1608	1408	mA
Bank interleave read I_{PP} current	I_{PP7}[1]	136	120	104	mA
Maximum power-down current	I_{DD8}[2]	288	288	288	mA

Notes:
1. One module rank in the active $I_{DD/PP}$, the other rank in $I_{DD2P/PP3N}$.
2. All ranks in this $I_{DD/PP}$ condition.

Serial Presence-Detect EEPROM

For the latest SPD data, refer to Micron's SPD page: www.micron.com/SPD.

Table 12: Serial Presence-Detect EEPROM DC Operating Conditions

Note:

All voltages referenced to V_{DDSPD}

Parameter/Condition	Symbol	Min	Max	Units
Supply voltage	V_{DDSPD}	2.2	3.6	V
Input low voltage: Logic 0; All inputs	V_{IL}	–0.5	V_{DDSPD} * 0.3	V
Input high voltage: Logic 1; All inputs	V_{IH}	V_{DDSPD} * 0.7	V_{DDSPD} + 0.5	V
Output low voltage: 3 mA sink current V_{DDSPD} >2V	V_{OL}	–	0.4	V
Input leakage current: (SCL, SDA) V_{IN} = V_{DDSPD} or V_{SSSPD}	I_{LI}	–	±5	µA
Output leakage current: V_{OUT} = V_{DDSPD} or V_{SSSPD}, SDA in Hi-Z	I_{LO}	–	±5	µA

Note: 1. Table provided as a general reference. Please consult JEDEC JC-42.4 EE1004 and TSE2004 device specification for complete details.

Table 13: Serial Presence-Detect EEPROM AC Operating Conditions

Parameter/Condition	Symbol	Min	Max	Units
Clock frequency	^{t}SCL	10	1000	kHz
Clock pulse width HIGH time	^{t}HIGH	260	–	ns
Clock pulse width LOW time	^{t}LOW	500	–	ns
Detect Clock Low Timeout	^{t}TIMEOUT	25	35	ms
SDA rise time	^{t}R	–	120	ns
SDA fall time	^{t}F	–	120	ns
Data-in setup time	^{t}SU:DAT	50	–	ns
Data-in hold time	^{t}HD:DI	0	–	ns
Data out hold time	^{t}HD:DAT	0	350	ns
Start condition setup time	^{t}SU:STA	260	–	ns
Start condition hold time	^{t}HD:STA	260	–	ns
Stop condition setup time	^{t}SU:STO	260	–	ns
Time the bus must be free before a new transition can start	^{t}BUF	500	–	ns
WRITE time	^{t}W	–	5	ms
Warm power cycle time off	^{t}POFF	1	–	ms
Time from power on to first command	^{t}INIT	10	–	ms

Note: 1. Table provided as a general reference. Please consult JEDEC JC-42.4 EE1004 and TSE2004 device specification for complete details.
